        predominantly in lymphocytes.";

J. BLOI. Chem. 272:22679-22684(1997).

-1- FUNCTION: CAN ACT. ON SUBSTRATES SUCH AS MYELIN BASIC PROTEIN AND HISTONE IIA ON SERINE AND THREONINE RESIDUES.

-1- CATALYTIC ACTIVITY: ATP + a protein - ADP + a phosphoprotein.

-1- TISSUE SPECIFICITY: EXPRESSED PREDOMINANTLY IN LYMPHOID ORGANS SUCH AS SPLEEN, THYMUS, AND BONE MARROW.

Consortium/LLNL at: http://image.llnl.gov Series: IRAL plate: 31 Row: p Column: 6
Series: clone was selected for full length sequencing because it This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis
This clone has the following problem: frame shifted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               USA

Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. Pirst strand CDNA was primed with a primer [5 GAGAGAGAGAGAGACCCTTTTTTTTTTTTTTTTTYN 3'], CDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 5.0 and subtraction to Rot = 25.0. Second strand cDNA was prepared with the primer adapter of sequence [5']
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        512

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung. NbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and so circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Benaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seq_name: /net/abss06/SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2001A.DAT:AAS11558
                                                  The invention relates to novel human proteins (NHP) and the nucleic acids encoding them. The nucleic acids encode mammalian transporter proteins and are useful for the treatment (e.g. by gene therapy or antisense technology) of any of a wide variety of symptoms associated with biological disorders (e.g. breast and prostate cancer) or imbalances and as probes for the identification, selection and validation of novel molecular targets for drug discovery. The proteins may be used to raise anti-NHP antibodies. The present sequence encodes an NHP of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human cDNA encoding novel human protein, NHP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel human proteins (NHP) and the nucleic acids encoding them. The nucleic acids encode mammalian transporter proteins and are useful for the treatment (e.g. by gene therapy or antisense technology) of any of a wide variety of symptoms associated with biological disorders (e.g. breast and prostate cancer) or imbalances and as probes for the identification, selection and validation of novel molecular targets for drug discovery. The proteins may be used to raise anti-NHP antibodies. The present sequence encodes an NHP of the

                                                                                                                                                                                            C. The invention relates to human nucleic acids (AAI57798-AAI61369) and C. the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful C. in gene therapy. A composition containing a polypeptide or polynucleotide C. of the invention may be used to treat diseases of the peripheral nervous Systems, such as peripheral nervous injuries, peripheral neuropathy and C. localised neuropathies and central nervous system disease, such as C. Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic C. lateral sclerosis, and Shy-Drager Syndrome. Other uses include the C. and thrombolytic activity, cancer diagnosis and therapy, drug screening, C. assays for receptor activity, arthritis and inflammation, leukaemias and C. Note: The sequence data for this patent did not form part of the printed cx specification.
